Abstract
This study was undertaken with the objective of evaluating six brands of Gatifloxacin tablets and the chemical equivalency with the use of an analytical method, which will be easy to use, accurate, reproducible, simple, and inexpensive. The chemical equivalence of six brands of Gatifloxacin tablets were assessed through the non-aqueous titration procedure with the use of crystal violet solution indicator. The non-aqueous titrimetric procedure showed that the excipients did not affect the procedure; with three brands having values within the range specified. While the remaining three brands gave lower values. The non-aqueous titrimetric procedure used in this study is simple, inexpensive, and easy to use and could be used in routine monitoring of the quality of Gatifloxacin tablets, especially in the absence of high technology equipments that are not easily available in most developing countries.

Key-Words: Gatifloxacin tablets, non-aqueous titration, chemical equivalence

Introduction
Gatifloxacin sold under the brand names Gatiflo, Tequin and Zymar, is an antibiotic of the fourth-generation fluoroquinolone family, that like other members of that family, inhibits the bacterial enzymes DNA gyrase and topoisomerase IV. Bristol-Myers Squibb introduced Gatifloxacin in 1999 under the proprietary name Tequin for the treatment of respiratory tract infections, having licensed the medication from Kyorin Pharmaceutical Company of Japan. Allergan produces an eye-drop formulation called Zymar. In many countries, gatifloxacin is also available as tablets and in various aqueous solutions for intravenous therapy. Gatifloxacin is currently available only in the US and Canada as an ophthalmic solution. In China it is sold in tablet as well as in eye drop formulations. Gatifloxacin was banned in India on the 18th of March along with Tegaserod. A statement from the health ministry said: The use of the following drugs is likely to involve certain risks to human beings, whereas safer alternatives to the said drugs are available.

Material and methods
Gatifloxacin pure powder was a gift from Windlass Pharmaceutical Industry, Dehradun while the various brands of the tablets were obtained from retail Pharmacies Dehradun, Reagents used include glacial
acetic acid, perchloric acid, acetic anhydride, potassium hydrogen phthalate, hydrochloric acid, crystal violet solution. Six different brands of Gatifloxacin tablets and the innovator brand with labeled contents of 100mg each.²₈

The percent of Gatifloxacin was determined by applying the following equations:

\[ M_1V_1 = M_2V_2 \]

Where, \( M_1 \) = Molarity of Gatifloxacin in sample solution, \( M_2 \) = Molarity of perchloric acid, \( V_1 \) = Volume of perchloric acid, \( V_2 \) = Volume of sample solution

\[ \text{Strength of Gatifloxacin (gm/ml)} = \frac{\text{Mol. Wt of Ciprofloxacin HCL} \times M_2}{1000} \]

\[ \text{Percentage of Gatifloxacin} = \frac{\text{wt of Gatifloxacin in sample solution} \times 100}{500} \]

Chemical content determination
Gatifloxacin pure powder: - 0.1g, 0.2g and 0.3g were dissolved in glacial acetic (15ml) acid, followed by the addition of freshly prepared mercuric (II) acetate solution (0.5ml, 1.0ml and 1.5ml respectively) and acetic anhydride (2ml, 4ml and 5ml respectively). The solutions were titrated against 0.1M acetous perchloric acid using 0.5%w/v crystal violet solution as indicator until a bluish – green end point. Blank titrations were carried out using 15ml glacial acetic acid. Titre values were adjusted by deducting the blank determination from the assay. This was carried out in triplicate Gatifloxacin tablets (Innovator brand):- Amounts of the crushed tablet material equivalent to 0.1g, 0.2g, 0.3g of pure Gatifloxacin in the tablet dosage form of the innovator brand were weighed. These were dissolved in 15ml glacial acetic acid, followed by the addition of freshly prepared mercuric (II) acetate solution (0.5ml, 1.0ml and 1.5ml respectively) and acetic anhydride (2ml, 4ml and 5ml respectively). The solution was titrated against 0.1M acetous perchloric acid using 0.5%w/v crystal violet solution as indicator until a bluish – green end point. Blank titrations were carried out using 15ml glacial acetic acid. Titre values were adjusted by deducting the blank determination from the assay. The procedure was carried out in triplicate. The procedure was then applied to ten other brands of Gatifloxacin tablets sourced from various pharmacy outlets.

Results and Conclusion
The result of the non-aqueous titration of Gatifloxacin pure powder at 0.1g, 0.2g and 0.3g and the equivalent weights of the powdered tablets of the innovator brand is presented in Table 1. The values obtained with the different concentrations showed that the excipients did not affect the procedure. The chemical content determination procedure used in this study involves the modification of the non-aqueous titration specified in B.P for Gatifloxacin HCl pure powder. The modification involves the addition of acetic anhydride and mercuric (II) acetate solution, using 5%w/v crystal violet solution as indicator. The application of the non-aqueous titrimetric procedure was based on the following equation:

\[ C_{60}H_{25}FN_{4}O_{2} + Hg(OAc)_{2} + HClO_{4} \rightarrow 2C_{60}H_{25}FN_{4}O_{2}H^{+} + HgCl_{2} + 2CH_{3}COOH + 2CO_{2} \]

The Gatifloxacin pure powder at 0.1, 0.2 &0.3g gave 99.12 ± 1.48, 100.17 ±1.54 & 100.37±1.03% w/w respectively which is in line with the USP 1990 specification of 90 – 110% w/w. Similarly, equivalent weights of the powdered Gatifloxacin tablets (innovator brand) gave 99.97 ± 2.78, 98.01 ± 1.89 & 100.27 ± 2.05% w/w respectively. The procedure was repeatable with consistent results and very good interday and intraday precision. The excipients of the tablets did not interfere with the assay procedure and result as the colour end point was clear and stable. The non-aqueous titrimetric procedure for the assay of Gatifloxacin used in this study is simple, inexpensive, reproducible and easy to use and could be used in routine monitoring of the quality of Gatifloxacin pure powder and tablets, especially in the absence of high technology equipment that are not easily available in most developing countries.
